## SECTION I.

INTRODUCTION. The purpose of this Technical Report is to review the System Segment Design Document, (Draft) Increment II, CDRL A002-04, which was produced for the Government by Evaluation Research Corporation. The results are provided in the form of Data Item Discrepancy worksheets as requested by the CMOS Program Office.

SUMMARY. Not Used.

CONCLUSION. Not Used.

SECTION II.

RESULTS.

Our analysis is provided in the attached Data Item  
Discrepancy worksheets.

COMMENT OR RECOMMENDED CHANGE:

Label the LGTX PC workstation as TEMPEST and add a PC workstation for LGTX on the LAN.

RATIONALE:

The TEMPEST workstation for LGTX is a non-CMOS function that is separate from the CMOS LGTX function available at any PC workstation on the LAN. See Increment II SSS paragraph 3.2.1.2.11 for a description.

PARA NUMBER: 3.5.2.3 a. and b.

COMMENT OR RECOMMENDED CHANGE:

Add an explanation of data base reconciliation following operations in Single Processor Site degraded mode with particular attention given to multiple transaction files and central data base corruption prevention.

RATIONALE:

Since a two processor site operates as a single processor site in degraded mode, and allows PCs to build transaction files to later update the central database, this explanation is necessary to address the SSS requirements for portability and operations when the database is inaccessible (SSS Change 02 pages 24 and 60, paragraphs 3.2.1.1.3.1 and 3.2.9).

Resolve the issue of which HWCi category the LAN transceivers and cables belong. Correct the paragraphs and corresponding tables.

RATIONALE:

Each paragraph above references tables that include LAN transceivers and cables as part of the LAN, Host Processor, and PC Workstation HWCIs. This causes these items to be over counted by a factor of three.

COMMENT OR RECOMMENDED CHANGE:

Add a data distributor and formatter to handle data transferred between CALM and CMOS.

RATIONALE:

The ASCII formatted files necessary for CALM processing (described in IRA 2-5, undated; paragraph 4.1.3.2, page 33; and SS2380, paragraph 3.2.3 of the SSS) must be produced and read by CMOS; this documentation should explain the design implications of the CALM/CMOS relationship. Whether that relationship is termed System Environment NDS or External Interface is inconsequential. The critical objective is to utilize CALM to process load plans and to accurately reflect the design in the SSDD.

RATIONALE:

SORTS reports are generated by the Transportation squadron and consolidated into a single product by a designated command element within the base. This occurs on a regular basis without regard to a mobility or crisis condition. See SSS paragraph 3.2.1 i.(9).

RATIONALE:

The SSS (paragraph 3.2.1.i(7)) does not exclude non-unit cargo from the requirement to send an ATCMD to the SSCO. The ATCMDs will be used to establish both the movement requirement and visibility over the items. This capability mirrors the practice used today for non-mobility cargo.

Requests for MAC airlift are made during the deliberate planning process and to support normal operations. When the mobility apparatus is not activated, an alternative OPR should be identified so as to make use of this capability.

COMMENT OR RECOMMENDED CHANGE:

Delete the transmittal of the load departure message to MAC in line 5.

RATIONALE:

There is no way to determine if this message is being sent to ADAM III at the MAC APOD or ADAM III at HQ MAC. More importantly, Increment I has established the mechanism for passing movement data (manifests, TCMDs, pallet headers, etc.) from CMOS to ADAM III and CMOS to CMOS when ADAM III is replaced. The capability to send ATCMD/Trailer data to the airlift clearance authority, who currently passes this to MAC, is also in place. MAC is reluctant to accept ATCMD/Trailer data directly from CMOS for mobility cargo due to system saturation problems. The load departure message would aggravate this situation.

COMMENT OR RECOMMENDED CHANGE:

The entry of marshalling completion time, or any other event driven completion time, should not be dependent on an operator action.

RATIONALE:

The Increment I design relies on the system to automatically enter the date and time of cargo incheck (SSS 3.2.1.2.1.3.4, 3.2.1.2.3.2.5, and 3.2.1.2.3.3.2). The solution presented above should also be done automatically based on completing the incheck and assigning a grid or marshalling yard location.

COMMENT OR RECOMMENDED CHANGE:

Please explain how the passing of load start and completion times in line 5 affects the concurrent display of the mission schedule on the TCU workstation. For example, what happens if a TCU controller is viewing the passenger load portion of the schedule at the same time that the APT operator is updating these fields on the APT workstation?

RATIONALE:

In the case cited above, two workstations have downloaded the same information from the central database. The APT workstation, in the course of updating this record, renders the TCU workstation's view of data stale. Does this mean the latter is relegated to operating with outdated information? What software mechanism prevents or corrects this situation?

Change the phrase "TCU PC workstation" in line 10 to "CMOS data base".

RATIONALE:

The surface move data is derived from the preplanning actions of the LGTX and surface freight functions. The TCU function is not operational in this phase. This data becomes part of the CMOS data base until execution.

Combine processes 1.4, 1.5, and 1.6 into 1.4 called "Mobility Activity Support". Depict Base\_Mobility\_Planning, Execute\_Deployment, and Execute\_Reception at the next lower level, 1.4.x. Illustrate the data flows between the basic mobility activities of planning, deployment, and reception.

RATIONALE:

The current illustrations of mobility activities do not depict CMOS\_Mobility\_Data as being utilized at each stage of mobility operations. The data flows and processes of mobility activities are not accurately represented.

Add the data flow for updates to pre-planned mobility data from COMPES. These updates will occur after execution orders arrive but before deployment.

RATIONALE:

Canned pre-plans are seldom executed without modifications arriving from COMPES prior to deployment.
